**CONTINUED**

**Scan Parameters:**

Labs obtained by the Emergency Department  
Intravenous contrast at the discretion of the Radiologist

**Patient Positioning:**

- Both arms raised above the head for optimal image quality.
- If only one arm can be raised, secure the opposing arm along the patient's side
- If both arms are unable to be raised, secure the arms along the patient's side

**Post contrast-** To include above apices through symphysis pubis

**Delay-** (*Delay time is dependent on the urgency induced by the patient condition*)  
To include above diaphragm through bladder

**CTDI:  $\leq 25$  mGy**

**Detector Rows: 128**

**Detector Configuration: 0.625**

**Rotation time: 0.35**

**Pitch: 0.992 mA: 550 kV: 120**

**Auto mA: on**

**Smart mA: on**

**Noise Index: 15.4**

<p><b>Reconstruction Parameters:</b></p> <p><b>Post Contrast</b></p> <p><b>Recon 1: Axial Soft Tissue through the entire scan range</b>                  2.5 mm slice thickness                  2.5 mm slice increment                  Algorithm: Standard                  W/L: 400/40                  ASIR: 50</p> <p><b>Recon 2: Axial Lung through the entire scan range</b>                  2.5 mm slice thickness                  2.5 mm slice increment                  Algorithm: Lung                  W/L: 1600/-600                  ASIR: none</p> <p><b>Recon 3: (reformat set) Axial Bone Recon of the Chest used for 3D Ribs:</b>                  0.625 mm slice thickness                  0.3125 mm slice increment                  Algorithm: Bone                  W/L: 400/40</p> <p>* <b>3D Ribs</b> – use recon 3 to create a 3D Volume Rendered rotation and 3D Bone Window rotation of the ribs.
