NOTE: Tape or strap patient’s feet together prior to scanning. Patient’s legs need to be as flat as possible. Include the hamstring attachment on the ischial tuberosity on the axial and coronal sequences.

**T1 Axial, T2 FS Axial (STIR Axial for Espree)**

Average Scanning Parameters:
- 360 mm FOV
- 5 x 1 mm slice thickness
- ~36 slices

Axial slices need to be parallel to the superior surfaces of the femoral heads, above sacrum through ischium.

**T1 Sagittal Bilateral**

Average Scanning Parameters:
- 220 mm FOV
- 4 x 1 mm slice thickness
- ~22 slices per side

**STIR Cor, T1 Cor**

Average Scanning Parameters:
- 360 mm FOV
- 4 x 0 mm slice thickness
- ~28 slices

Coronal slices need to be parallel to the anterior surfaces of the femoral heads.
